

SPARQL endpoint: <a href="http://virtuoso-midi.amp.ops.labs.vu.nl/sparql">http://virtuoso-midi.amp.ops.labs.vu.nl/sparql</a> <a href="https://github.com/midi-ld/midi2rdf/">https://github.com/midi-ld/midi2rdf/</a>

## 1. Search for song 1 (use query 1):

# The result contains three songs, I choose for the version:

BLACK SABBATH.War pigs.mid

## which has the following pattern:

http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4

## 2. Search for tempo values of song 1 (use query 2):

# This results in the following tempo values:

```
- resolution: 480
- denominator: 4
- metronome: 24
- numerator: 4
- thirtyseconds: 8
```

#### 3. Search for song 2 with the same tempo values (use guery 3):

```
PREFIX prov: <a href="mailto:ref">ref">http://www.w3.org/ns/prov#></a>
PREFIX mid: <http://purl.org/midi-ld/midi#>
SELECT DISTINCT ?pattern ?filename
WHERE {
?pattern prov:wasDerivedFrom ?filename .
?pattern mid:hasTrack ?track .
?pattern mid:resolution 480 .
?track mid:hasEvent ?timesignatureevent .
?timesignatureevent a mid:TimeSignatureEvent .
?timesignatureevent mid:denominator {\bf 4} .
?timesignatureevent mid:metronome 24 .
?timesignatureevent mid:numerator {\bf 4} .
?timesignatureevent mid:thirtyseconds 8 .
FILTER (regex(?filename, "mozart", "i")) . #optional
```

## **LIMIT 1000**

I thought it was interesting to combine War Pigs with something Classic, so I filtered on "Mozart". This query took quite some time to load, but after it was loaded I found the song: "1mov "Eine Kleine Natchmusik".mid" which I thought was interesting. I will continue with this as second song.

# The song has the following pattern:

http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6

#### 4. Combine the songs (use query 4)

```
PREFIX prov: <a href="mailto://www.w3.org/ns/prov#">http://www.w3.org/ns/prov#>
PREFIX mid: <a href="mailto:ref">http://purl.org/midi-ld/midi#></a>
CONSTRUCT { <newsong> a mid:Pattern ;
mid:hasTrack ?track .
<newsong> mid:format ?format .
<newsong> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?track a mid:Track .
?event a ?type .
?event ?property ?value .
WHERE {
<http://purl.org/midi-ld/pattern/cb87a5bb1a44fa72e10d519605a117c4> mid:hasTrack ?track .
\verb|\display| < http://purl.org/midi-ld/pattern/cb87a5bb1a44fa72e10d519605a117c4> \ \texttt{mid:format} \ \ ? format \ \ .
<http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?event a ?type .
?event ?property ?value .
} IINTON {
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:hasTrack ?track .
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:format ?format
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?event a ?type .
?event ?property ?value .
```

Note that the Results Format should be set to "Turtle"

## 5. Convert RDF to MIDI

- 1. The result from the preceding step needs to be copied to a .txt file
  - see example.txt
- 2. After this, change the .txt extension to .ttl
  - see example.ttl
- 3. Follow the steps on https://qithub.com/midi-ld/midi2rdf/ to convert the RDF file to a MIDI file

## 6. Evaluate result

- Use a tool that can play MIDI to evaluate the result 1
- 2. Listen to the result
- Decide whether you think the songs can be a mashup

- In theory they match because the songs have the same tempo, but the song still needs to sound appealing. This is just your own opinion, but since it is your own mashup you can decide what you want.
- 4. If you think the songs can't be a mashup, go back to step 3
- 5. Since I think the songs can be a mashup, I am going to query for the tracks of both songs

#### 7. Search for the tracks of a song (use query 5)

I want from War Pigs only the drum track, this is the second track of War Pigs. This can be derived from both the mashup, or if this is too hard from the War Pigs MIDI itself.

```
PREFIX prov: <http://www.w3.org/ns/prov#>
PREFIX mid: <http://purl.org/midi-ld/midi#>
SELECT ?track
WHERE {
<http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4> mid:hasTrack ?track .
}
```

After querying the tracks of War Pigs, I see that the second track is referred to using: http://purl.org/midi-ld/pattern/cb87a5bb1a44fa72e10d519605a117c4/track01

From Eine Kleine Nachtmusik I want all tracks, so I do not have to query for the tracks of this song.

#### 8. Combine the songs, using the desired tracks (use guery 6)

```
PREFIX prov: <a href="mailto:ref">ref">http://www.w3.org/ns/prov#>
PREFIX mid: <a href="mailto:ref">ref">http://purl.org/midi-ld/midi#></a>
CONSTRUCT { <newsong> a mid:Pattern ;
mid:hasTrack ?track
<newsong> mid:format ?format .
<newsong> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?track a mid:Track .
?event a ?type
?event ?property ?value .
WHERE {
<http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4> mid:hasTrack ?track .
<http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4> mid:format ?format
<http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?event a ?type .
?event ?property ?value
FILTER (?track IN (<a href="http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4/track01">http://purl.org/midi-ld/pattern/cb87a5bbla44fa72e10d519605a117c4/track01</a>,
<arbitrary>))
} UNION {
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:hasTrack ?track .
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:format ?format
<http://purl.org/midi-ld/pattern/6702325c4f08ece510e48093035e9fa6> mid:resolution ?resolution .
?track mid:hasEvent ?event .
?event a ?type .
?event ?property ?value .
```

Since I want all tracks from Eine Kleine Nachtmusik, I omitted the second track filter.

## 9. Convert RDF to MIDI

see step 5

## 10. Evaluate result

The result sounds like a mashup. I am going to leave it like this.

## 11. Mashup

We have now constructed a MIDI Linked Data mashup, generated by the SPARQL query in step 8.
